TransferProtocolSDK 통합 가이드

1. 디바이스 연결 및 UUID 사용자 정의 필요

```
public static final String SERVICE_UUID =
"0000ff01-0000-1000-8000-00805f9b34fb";public static final String
CHARACTERISTIC_WRITE_UUID =
"0000ff02-0000-1000-8000-00805f9b34fb";public static final String
CHARACTERISTIC_READ_UUID =
"0000ff10-0000-1000-8000-00805f9b34fb";public static final String
DESCRIPTOR_UUID = "00002902-0000-1000-8000-00805f9b34fb";
```

2. SDK 사용 방법

1. libs 디렉터리에 transferprotocolsdk.jar 파일을 추가합니다.

1. AndroidManifest.xml 에 다음 권한을 추가해야 하며, 동적 권한은 별도로 요청해야 합니다

```
<uses-permission
android:name="android.permission.BLUETOOTH" />
<uses-permission
android:name="android.permission.BLUETOOTH_ADMIN" />
<uses-permission
android:name="android.permission.ACCESS_FINE_LOCATION" />
>
```

1. 앱의 Application 클래스에서 BleTransferManager를 초기화합니다:
public static MainApplication mainApplication;
public static BleTransferManager manager;
public static MainApplication getInstance() {
 return mainApplication;
}

```
@Override
public void onCreate() {
    super.onCreate();
    mainApplication = this;
    manager = BleTransferManager×initialized(this);
```

1. UI Activity 또는 Fragment의 생명주기 메서드에서 다음 콜백을 설정하세요. 필요 시 Application에서 설정해도 됩니다:

@Override

```
protected void onCreate(Bundle savedInstanceState) {
   super.onCreate(savedInstanceState);
   setContentView(R.layout.activity_main);
```

manager.setBTMGattCallBack(this);//블루투스 상태 콜백 설정
manager.setAnalyticalDataCallBack(this);// 블루투스 데이터 전송 콜
백 설정

1. 连接Gatt

manager.connectGatt(macAddress, false); // 매개변수1: MAC 주소, 매개변수2: 페어링 여부

1. 断开Gatt

manager.disconnectGatt(macAddress, false); // 매개변수1: MAC 주소, 매개변수2: 페어링 해제 여부 (페어링 해제는 리플렉션으로 숨겨진 API를 호출하는 방식으로, 실패할 수도 있음)

- 1. 커스텀 블루투스 Gatt 객체를 사용해 연결하려면 다음을 사용. manager.setBluetoothGatt(BluetoothGatt bluetoothGatt);
 - 1. 데이터 송수신에 관한 더 자세한 내용은 API 문서 및 예제 Demo의 MainActivity 코드를 참고하세요.
